SUMMARY

AWS Certified Solutions Architect and a **DevOps** engineer who runs production AWS and **Kubernetes** and makes it faster, cheaper and more secure. In 3 years I've cut **CI/CD** build times by **79%**, lowered AWS bills by **15–23%** at two companies, **contained a live AWS security attack**, and moved every engineer to **AWS SSO** with **zero disruption**. I also build **AI agents** that resolve infrastructure tickets end to end.

Quintype Technologies **Jul 2026 – Present**
DevOps Engineer *Bengaluru, India*

- Reduced AWS spend by **15%** (**$40K to $34K/month**, **~$72K/year**) by optimizing **EC2**, **RDS**, **S3**, **ELB**, and **Route 53**.
- Automated routine infrastructure tickets **end to end** by building an **AI DevOps agent** on **LangChain** and **LangGraph**, using **MCP servers** and custom tools to generate **Terraform** for **Cloudflare** block rules and handle **GitHub** access requests.
- **Contained and remediated an active security attack** on production AWS, then hardened every account with **Service Control Policies (SCPs)** across **AWS Organizations** and automated alerting on any new resource creation.
- **Eliminated long-lived IAM user credentials** for all engineers and testers, with **zero disruption** to development or QA, by migrating access to **AWS IAM Identity Center (SSO)**.
- **Reduced the IAM attack surface** across all AWS accounts by auditing every permission and replacing broad grants with **least-privilege**, fine-grained role policies.
- **Removed static IAM access keys** from application workloads by upgrading production **Amazon EKS** and migrating services to **IAM Roles for Service Accounts (IRSA)** through AWS IAM and **Chef** changes.
- Enabled **secure, auditable credential storage** and sharing across teams by deploying self-hosted **Passbolt** on **EKS**, provisioned with **Terraform** and **Chef**.
- Optimized and budgeted company **AI tooling spend**, and standardized AI usage best practices through written guidelines and engineering training sessions.

SecPod Technologies Pvt Ltd **Jul 2025 – Jun 2026**
DevOps Engineer *Bengaluru, India*

- Reduced AWS spend by **23%** by replacing **Transit Gateway** with **VPC peering** to remove per-GB transit fees, rightsizing **EC2** root volumes from **100 GB to 30 GB**, and tiering cold **EFS** data to Infrequent Access.
- Cut **CI/CD** build time by **79% (120 to 25 min)**, enabling **3+ release windows per day**, by redesigning **Jenkins** pipelines with parallel stage execution and a high-availability controller.
- Shipped an **MCP server** to production **Kubernetes** with **zero manual intervention** by authoring production-grade **Helm charts** and owning the full **Argo CD GitOps** release lifecycle, from chart authoring to rollout.
- Eliminated the database **single point of failure** and achieved **multi-master high availability** by migrating from **Amazon RDS** to a self-managed **MariaDB Galera** cluster, with query-level observability in **Percona PMM**.
- Eliminated **configuration drift** across all environments by codifying **100%** of production infrastructure in **Terraform** and enforcing immutable deployments.
- Achieved **compliance readiness** for enterprise security audits by hardening the software supply chain with automated **SAST**, **dependency scanning**, and **SBOM** generation in every **CI/CD** run.

Nokia Solutions and Networks India Pvt Ltd **Nov 2023 – Jun 2025**
Associate R&D Engineer *Bengaluru, India*

- Reduced regression MTTD by **20%** and go/no-go decision time from **hours to minutes** for **18+ engineering managers** by designing **CI Cockpit**, an **Elasticsearch**-backed dashboard centralizing regression trends, pipeline metrics, and release health; won the **SSP Excellence Award**.
- Reduced flaky builds and improved release cadence for a **100+ engineer** R&D org by re-architecting **Jenkins CI/CD** pipelines through performance tuning and workflow redesign.
- Cut manual release effort by **~40%** by building and standardizing **Helm chart** pipelines for **Kubernetes** delivery.
- Saved **~3 hours/week** of manual status reporting per team by integrating **JIRA** with CI pipelines for automatic commit-to-resolution traceability.

PROJECTS

InstaDeploy | *Docker, Docker Compose, TLS, CI/CD* github.com/codeinja/instadeploy

- Architected a self-hosted **PaaS** with a pull-based **control plane**: the server only records desired state, while per-host agents long-poll a task queue and run containers.
- Exposed apps on public **HTTPS** URLs with **zero open ports** through outbound tunnels to an edge gateway that terminates **TLS**.
- Automated **continuous deployment** on every git push, with versioned revisions, one-click **rollback**, health checks, live logs, and resource metrics across production, staging, and dev environments.
- Hardened by default with encrypted secrets redacted from logs, revocable per-host tokens, and policy checks that block privileged containers, host networking, and **Docker** socket mounts.

TECHNICAL SKILLS

Cloud (AWS): EC2, EKS, S3, RDS, VPC, IAM, IAM Identity Center (SSO), Organizations/SCPs, Lambda, CloudWatch, EventBridge, Route 53, ELB, OpenSearch, ElastiCache

Infrastructure as Code: Terraform, Chef, Cloudflare

Containers & GitOps: Kubernetes (EKS, kubeadm), Docker, Helm, Argo CD, IRSA

CI/CD & DevSecOps: Jenkins (HA), CircleCI, Rundeck, GitHub, JFrog Artifactory, SAST, SBOM, Passbolt

Databases: MariaDB Galera, PostgreSQL, Amazon RDS, Percona PMM

Observability: Prometheus, Grafana, Elasticsearch, CloudWatch

AI & Languages: LangChain, MCP, Python, Bash, Groovy

CERTIFICATIONS & AWARDS

AWS Certified Solutions Architect – Associate | Credential ID - 3846a67a-2bed-42d4-bcce-54bb1077b29c *AWS*

SSP Excellence Award – for designing CI Cockpit, the R&D org's primary regression-analysis tool *Nokia*

EDUCATION

Master of Computer Applications (MCA), RV College of Engineering, Bengaluru **Feb 2023 – Sep 2024**

Bachelor of Computer Applications (BCA), New Horizon College, Bengaluru **Jun 2019 – Oct 2022**
